

Dormancy 6 - Hunterfield was selected from Hunter River for aphid resistance. It displays varying resistance to the different aphid groups, but is susceptible to the major lucerne diseases, Colletotrichum Crown Rot (*Colletotrichum trifolii*), Bacterial Wilt (*Clavibacter michiganense*) and Fusarium Wilt (*Fusarium oxysporum*). With its low lying crown, Hunterfield shows good persistence under grazing, especially in low to moderate rainfall situations. However, due to its disease susceptibility it is not recommended for long term stands in high rainfall or irrigated situations.

- Dormancy Rating 6
- Suited to low to medium rainfall grazing situations
- Susceptible to all major lucerne diseases
