

Enduro is an aerial seeding, self regenerating annual pasture legume originating from South Africa derived from Paradana germplasm with selection for early maturity and winter active growth. Enduro is an early maturing Balansa clover with Frontier-type maturity, developed for the 350-500mm rainfall areas. Enduro provides valuable grazing for livestock produces bulky hay crops and improves crop yields through nitrogen fixation. Enduro is well suited to a range of farming systems.

- Early maturing, two weeks earlier than Paradana
- Improved winter growth over all other Balansa cultivars
- High dry matter production
- Recovers strongly from heavy grazing
- Excellent regeneration from high seed yields and hard seed levels
- Tolerates water logging and mild soil salinity
- Broad adaptation to a variety of soil types
- Ideal legume for nitrogen fixation in cropping rotations
