

Annual self-regenerating legume, suited to a wide range of soil especially lighter textured soils. It is sensitive to heavy grazing or cutting and is an ideal pioneer legume. Rose clovers are deep rooted, with small, hairy leaves providing palatable and non-bloating forage for animals. Hykon has been replaced by the more hardseeded and persistent variety SARDI rose clover.

- Ideal pioneer species
- Early maturing and suited to low rainfall environments
- Non bloating
- Replaced by SARDI Rose Clover
