

Balance chicory has been selected for its rapid establishment, perennial nature with excellent winter growth. Balance is a high quality leafy herb with a deep taproot, providing excellent quality feed for high levels of stock production. The plant grows from a low rosette producing broad upright leaves and is best suited to fertile, free draining soils with a pH from 5.5-8. Animals fed chicory perform very well. Balance chicory provides them with a highly digestible feed source with a good protein/energy ratio and a high mineral content resulting in high live weight gains. Balance should be sown in the autumn with soil temps above or around 10°C, or in high rainfall/irrigation it can be sown in the spring. It can be sown in a pasture mix and is very responsive to nitrogen fertilizers.

- Rapid establishment and excellent winter growth
- Quality feed - high stocking rates
- Autumn or spring sowing option
- Useful as a hard grazing option in a rotational system
- Excellent weight gains
- Pasture mix option
