

Zulumax Arrowleaf Clover is an annual legume used for both grazing and fodder conservation (hay, silage option). It exhibits good cold tolerance and germinates well at low temperatures. Ideally suited to loam and sandy soils with a pH of 5 to 7.5. Zulumax Arrowleaf Clover is generally a better cattle feed option due to its erect growth and non bloating ability. It does have a fit for lambs and sheep. Zulumax Arrowleaf Clover can reach a height of one metre with good tiller development. Large leaves maximises forage density.

- Excellent grazing or fodder conservation option
- Good cold tolerance for better germination and vigour
- Preferred option for loam and sandy soils (pH 5 to 7.5)
- Good hard seed levels for good regeneration
- High yields of quality fodder
- Erect growth habit
