

Hatrik is a mid season cultivar, well adapted to waterlogged and poorly drained soils particularly over winter. Hatrik has good winter and early spring production. It has been selected for seedling vigour, high herbage production and tolerance to waterlogging with a high seed yielding ability to ensure long term clover dominant pastures. Vigorous growth and improved disease resistance ensures Hatrik provides bountiful, high quality forage for grazing, hay or silage production.

- Tolerant to waterlogged or poorly drained soils
- Excellent seedling vigour
- High herbage production
- Good seed yields
